#### ABSTRACT

List of freshwater fishes and lampreys of Central Poland was prepared by a critical review of literature data and including some unpublished information. A total of two lampreys and 42 fish species were recorded, in the Pilica, upper Warta and Rawka drainage basin, nowadays. According to the new IUCN/WCU criteria 23 species are considered those of least concern (LC), 1 critically endangered (CE), 4 endangered (NE), 6 vulnerable (VU) and 2 and 3 conservation dependent (CD) or near threatened (NT), respectively. The distribution of all threatened species, their frequency of occurrence and relative abundance are presented.
